
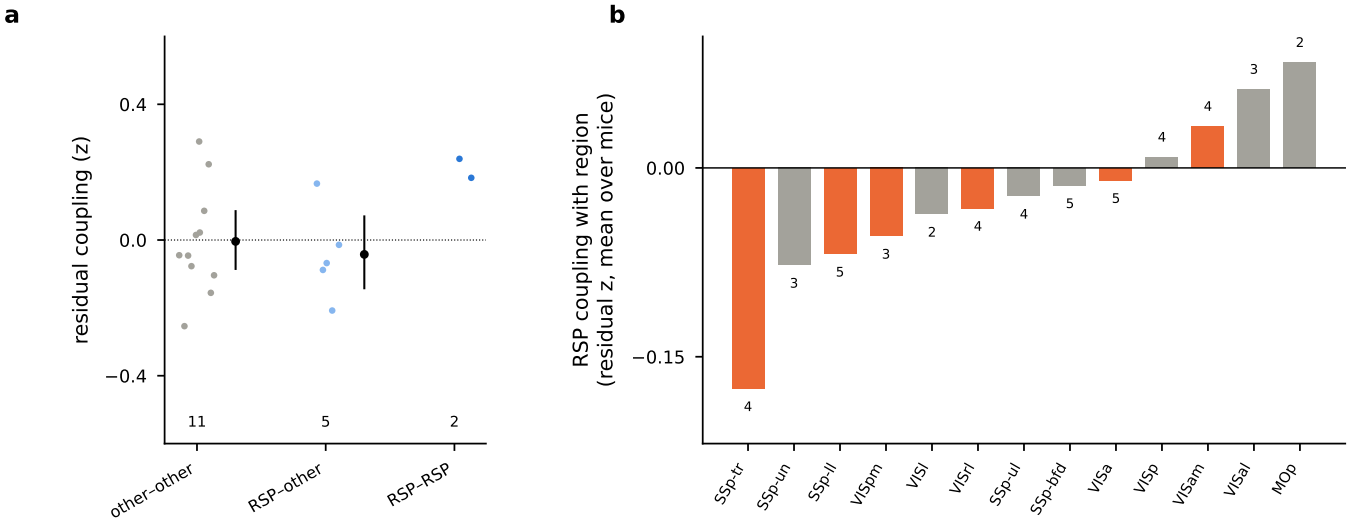

Figure 9: a Mesoscope, inter-trial rest (the grey screen images RSP in only 1–2 mice): still 1 s bins from 1 s after feedback to 0.2 s before the next stimulus, nuisance-regressed; RSP pairs from 14 sessions, 5 mice. The mesoscope images no frontal core region, so the core is RSPagl and RSPd. Residual coupling (distance-matched) per pair class, averaged per mouse (dots; number of mice at the bottom); black, mean and 95% bootstrap CI where $\geq$3 mice. **b** Mean residual coupling of RSP with each imaged region (pairs in $\geq$2 mice; numbers above bars: mice), orange: regions assigned to the DMN by at least one paper (Fig. 1) but not in the core; grey: in none.
